View(metadata)

dim(counts)

[1] 38694 8

Q1 How many genes are in this dataset? 38694 genes Q2. How many 'control' cell lines do we have? 4 controls

Toy differential gene expression

```
control <- metadata[metadata[,"dex"] == "control",]
control.counts <- counts[ ,control$id]
control.mean <- rowSums( control.counts )/4
head(control.mean)

## ENSG000000000003 ENSG0000000005 ENSG00000000419 ENSG00000000457 ENSG00000000460
## 900.75 0.00 520.50 339.75 97.25
## ENSG00000000938
## 0.75</pre>
```

Q3. How would you make the above code in either approach more robust?

```
library(dplyr)

0.75

ENSG0000000938

Double check with the id

can use all function here. all(c(T,T,T,F,T))

how to check if anything false? you can use! it will flip all the things

```
metadata$id == colnames(counts)

## [1] TRUE TRUE TRUE TRUE TRUE TRUE TRUE

colnames(counts)

## [1] "SRR1039508" "SRR1039509" "SRR1039512" "SRR1039513" "SRR1039516"

## [6] "SRR1039517" "SRR1039520" "SRR1039521"

treated <- metadata[metadata[,"dex"]=="treated",]
treated.mean <- rowSums( counts[ ,treated$id] )/4
names(treated.mean) <- counts$ensgene</pre>
```

We will combine our meancount data for bookkeeping purposes.

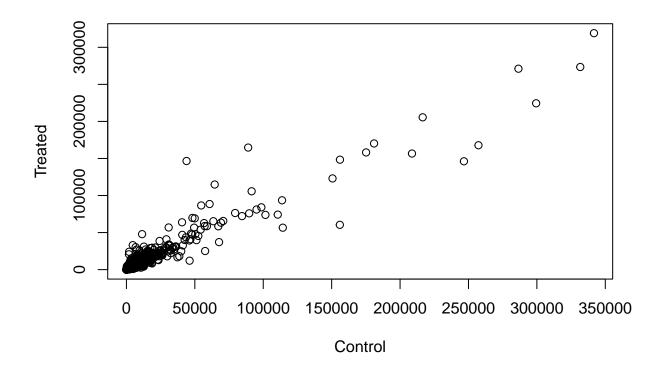

```
meancounts <- data.frame(control.mean, treated.mean)

colSums(meancounts )

## control.mean treated.mean
## 23005324 22196524</pre>
```

Q5 (a). Create a scatter plot showing the mean of the treated samples against the mean of the control samples. Your plot should look something like the following.

```
plot(meancounts[,1],meancounts[,2], xlab="Control", ylab="Treated")
```

Q5 (b). You could also use the ggplot2 package to make this figure producing the plot below. What geom_?() function would you use for this plot? geom_point

Q6. Try plotting both axes on a log scale. What is the argument to plot() that allows you to do this?

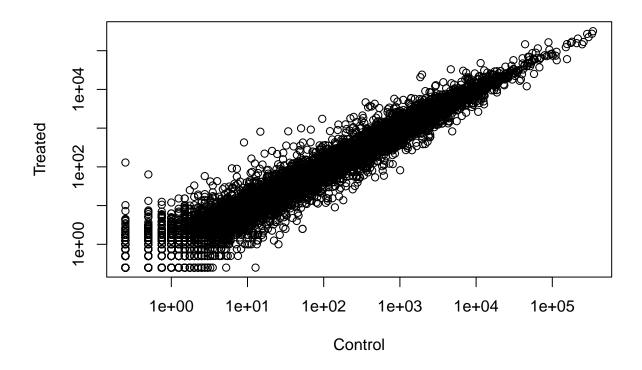

```
plot(meancounts[,1],meancounts[,2], log="xy", xlab="Control", ylab="Treated")

## Warning in xy.coords(x, y, xlabel, ylabel, log): 15032 x values <= 0 omitted

## from logarithmic plot

## Warning in xy.coords(x, y, xlabel, ylabel, log): 15281 y values <= 0 omitted

## from logarithmic plot</pre>
```

We can find candidate differentially expressed genes by looking for genes with a large change between control and dex-treated samples. We usually look at the log2 of the fold change, because this has better mathematical properties.

```
meancounts$log2fc <- log2(meancounts[,"treated.mean"]/meancounts[,"control.mean"])</pre>
head(meancounts)
##
                    control.mean treated.mean
                                                     log2fc

                                      1785.75 -0.38194109
```

Q7. What is the purpose of the arr.ind argument in the which() function call above? Why would we then take the first column of the output and need to call the unique() function?

The arr.ind=TRUE argument will clause which() to return both the row and column indices (i.e. positions) where there are TRUE values. In this case this will tell us which genes (rows) and samples (columns) have zero counts. We are going to ignore any genes that have zero counts in any sample so we just focus on the row answer. Calling unique() will ensure we dont count any row twice if it has zer entries in both samples.

```
up.ind <- mycounts$log2fc > 2
down.ind <- mycounts$log2fc < (-2)</pre>
```

Q8. Using the up.ind vector above can you determine how many up regulated genes we have at the greater than 2 fc level? 250 Q9. Using the down.ind vector above can you determine how many down regulated genes we have at the greater than 2 fc level? 367 Q10. Do you trust these results? Why or why not? No, all our analysis has been done based on fold change. We have not done anything yet to determine whether the differences we are seeing are significant.

4. DESeq2 analysis

```
library(DESeq2)
citation("DESeq2")
```

```

add annotation Data

Let's install -BiocManager::install("AnnotationDbi") -BiocManager::install("org.Hs.eg.db")

```
# add annotation Data
library("AnnotationDbi")

##
## Attaching package: 'AnnotationDbi'

## The following object is masked from 'package:dplyr':
##
## select
```

```
library("org.Hs.eg.db")
```

##

We can now use te 'mapIDs' function from the annotation function from the AnnotationDbi package to find

```
# First, let us see what is available in the annotation columns(org.Hs.eg.db)
```

```
